**CS-360— Assignment 7-2:**

**Inventory Mobile Application Launch Plan**

Prepared on: October 19, 2026

Prepared for: Dr. Alejandro Benavente

Prepared by: Alexander Ahmann

The following outlines a launch plan for the "Inventory App" as outlined by CS-360 (n.d.). At the moment, it is still in the alpha stages of development. The current issues that plauge the inventory app include, but are not limited to, item update mechanism not implemented, the SMS notification being limited to a proof-of-concept, and an inconsistent coding style.[1] Because of these limitations, the Inventory App is not ready to be published onto Google Play.

Nonetheless, it would be a good exercise to plan out how to go about publishing a mature product, or even just a beta of the app when it has been deemed to be mature enough, and when it can be put to the market in an both an ethical and "value adding" manner. When publishing my inventory app, I should describe its simplistic and minimalistic design features for taking note of items in an inventory or warehouse, and maybe use an icon depicting a coloured sketch of a warehouse, with the "realistic" details abstracted out to advertise its simplicity.

Regarding what version of Android that the Inventory App will run on, I have

[1] See Ahmann (2026) for a full list of work done for implementing the Android app.

configured the `build.gradle` to have a minimum API version of 30, and a target API of 37. So, it will run on Android 11 phones, which make up about 86.9 per cent of the Android phone market.[2] At the moment, the Inventory App only asks for access to SMS functions for notifications, but it may request more permissions as more functionality is added, and depending on a host of factors that I cannot forsee. Finally, regarding monetization, I will opt to sell a perpetual software licence[3] for a "fair" price like $5.00 [USD].
